Description:
The UMFConfigParser is an abstract class used to create custom config parsers.

Added In: v0.45

Function

```
public abstract class UMFConfigParser<T>
{
    public virtual T Parse(string value)
    {
        return default(T);
    }
    public abstract override string ToString();
    public virtual string Default()
    {
        return null;
    }
    public virtual string Range()
    {
        return null;
    }
    public virtual string Vanilla()
    {
        return null;
    }
    public virtual string Allowed()
    {
        return null;
    }
    public virtual string Restart()
    {
        return null;
    }
    public virtual string IsKeyBind()
    {
        return null;
    }
}
```

Usage

```
//Coming soon
```

Examples

```
//Coming soon
